

# **Upgrade of the MDC-DAQ system**

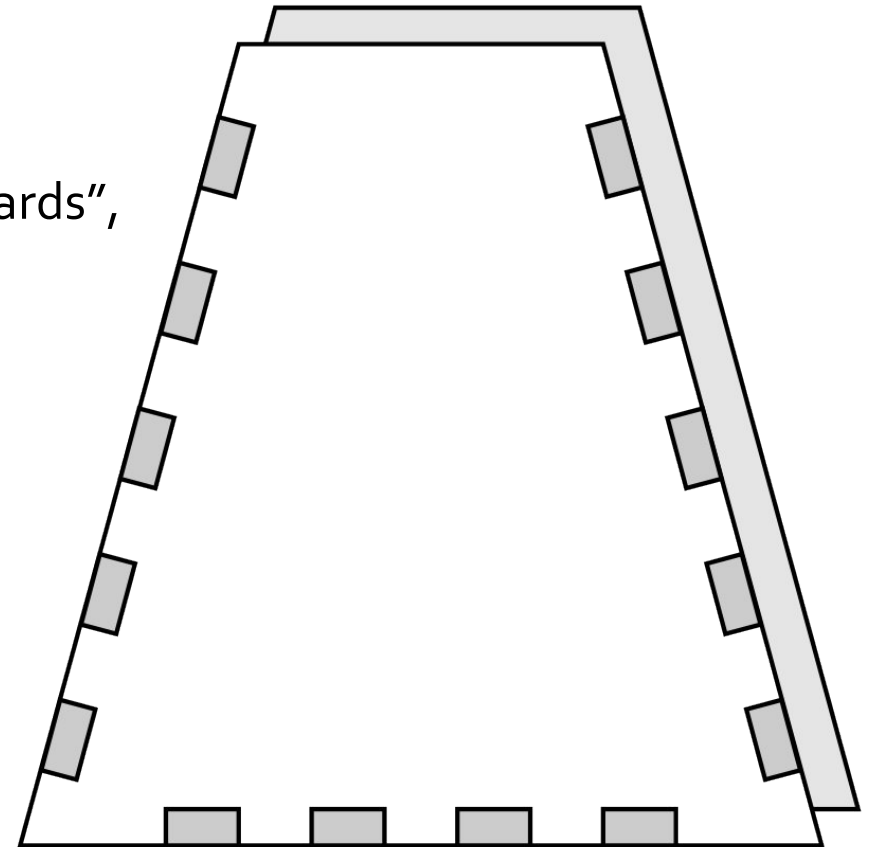

**Jan Michel**

**October 2009**

# MDC DAQ – Front End Electronics (FEE): Motherboards

- Each chamber is equipped with 16 “motherboards”, each carrying TDCs and
- “daughterboards” with amplifiers
- Amplifies analog signals from sense wires
- 64 or 96 channels
- Time resolution 500 ps

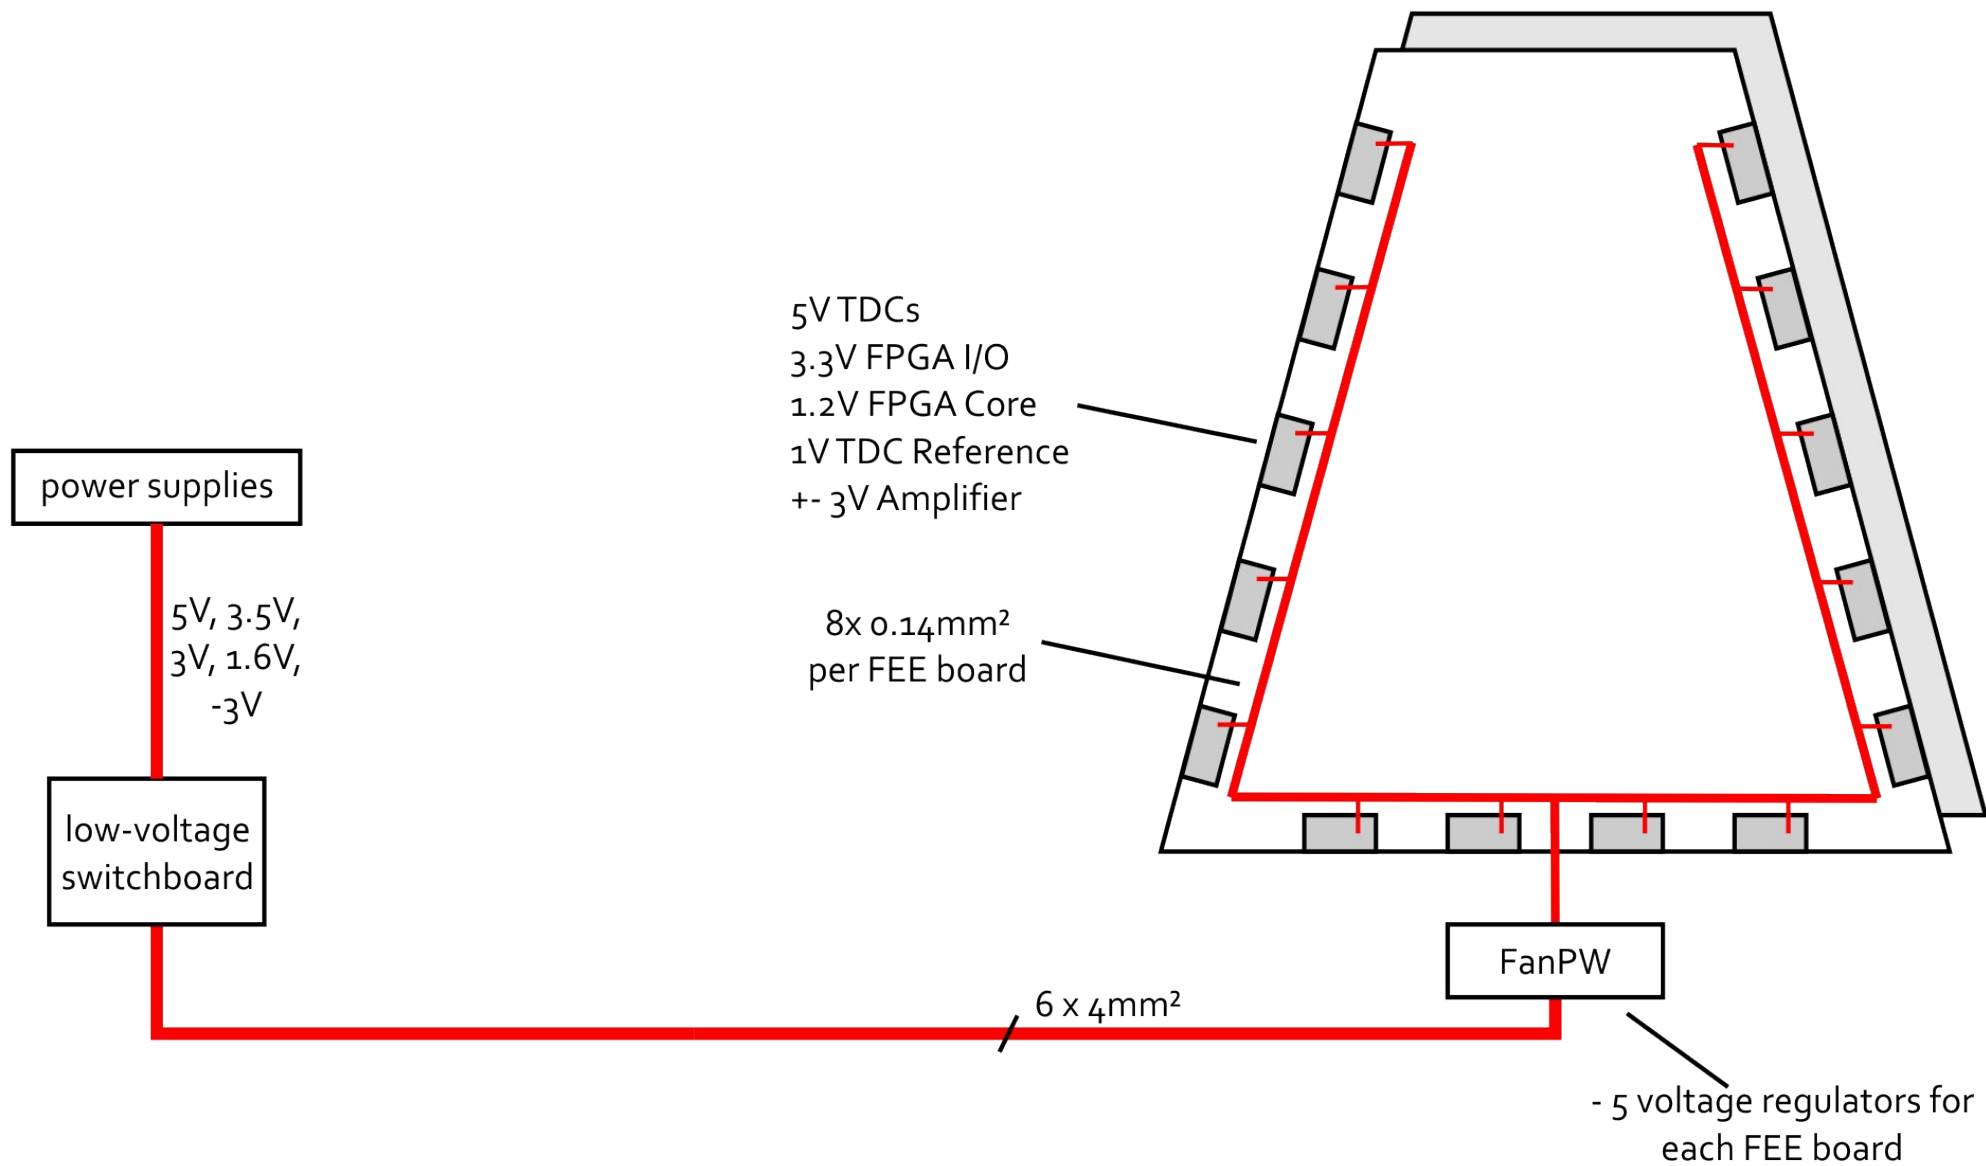

# MDC DAQ – Front End Electronics: OEP

- FPGA configures, controls and read data from motherboards
- Sends data to PCs / storage (Eventbuilder)
- Motherboard and OEP need many voltages: 5V, 3.3V, 1.2V, 1V, +3V, -3V
- All voltages are monitored, 4 are regulated on-board
- 2 Flash ROMs to store different FPGA designs
- Temperature sensor
- 250 Mbit/s optical transceiver
- ... and all on a board measuring just 4 x 5 cm<sup>2</sup>!

# MDC DAQ: Power distribution

# MDC DAQ: Power distribution - Components

# MDC DAQ: Power distribution - Components

120 relais & fuses  
800 A total current  
5 voltages between -3 and 5V

power supplies

low-voltage  
switchboard

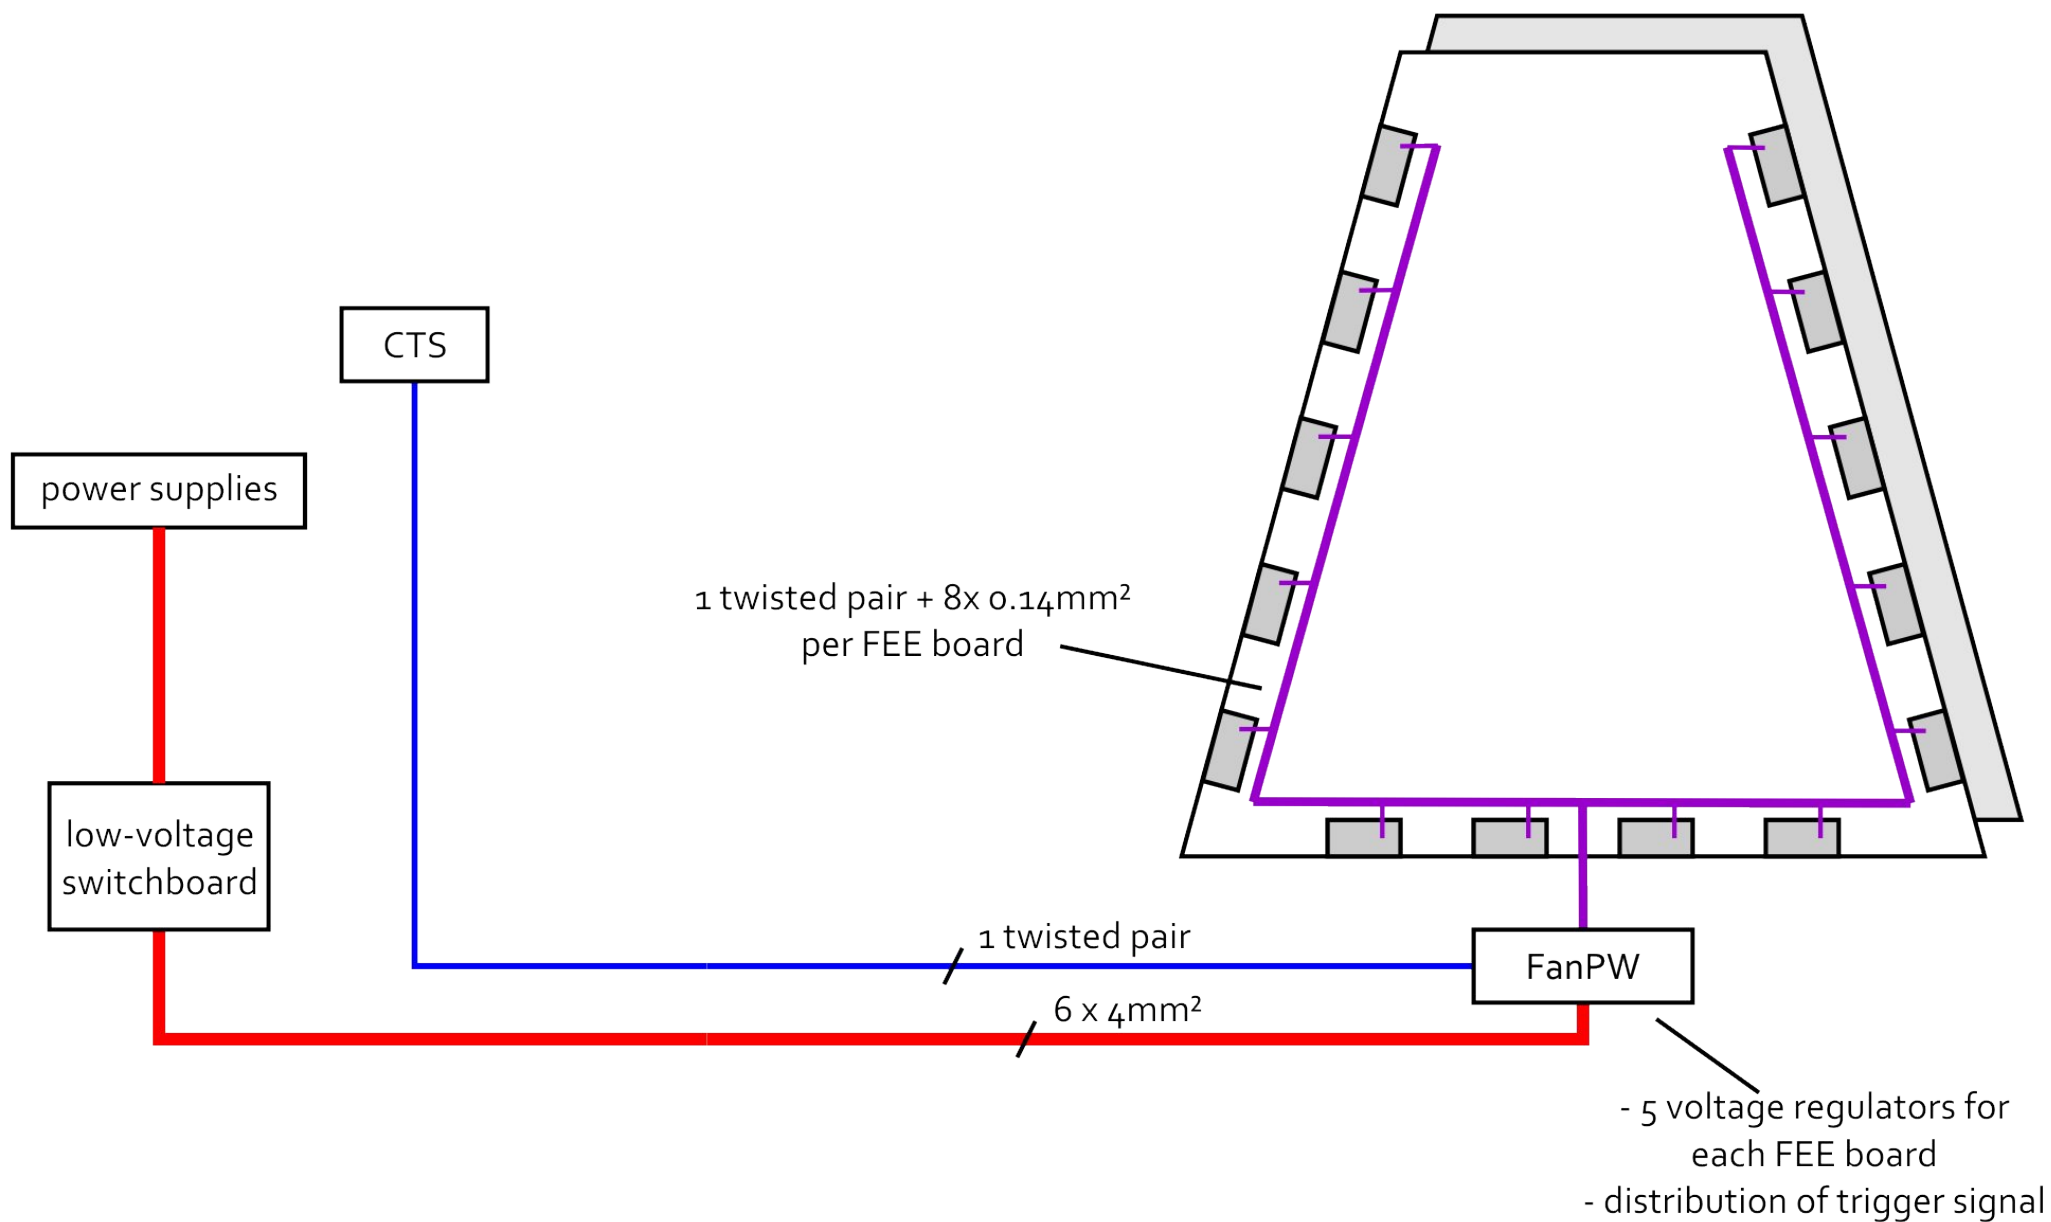

# MDC DAQ: Power distribution - Components

108 voltage regulators  
35 A total current

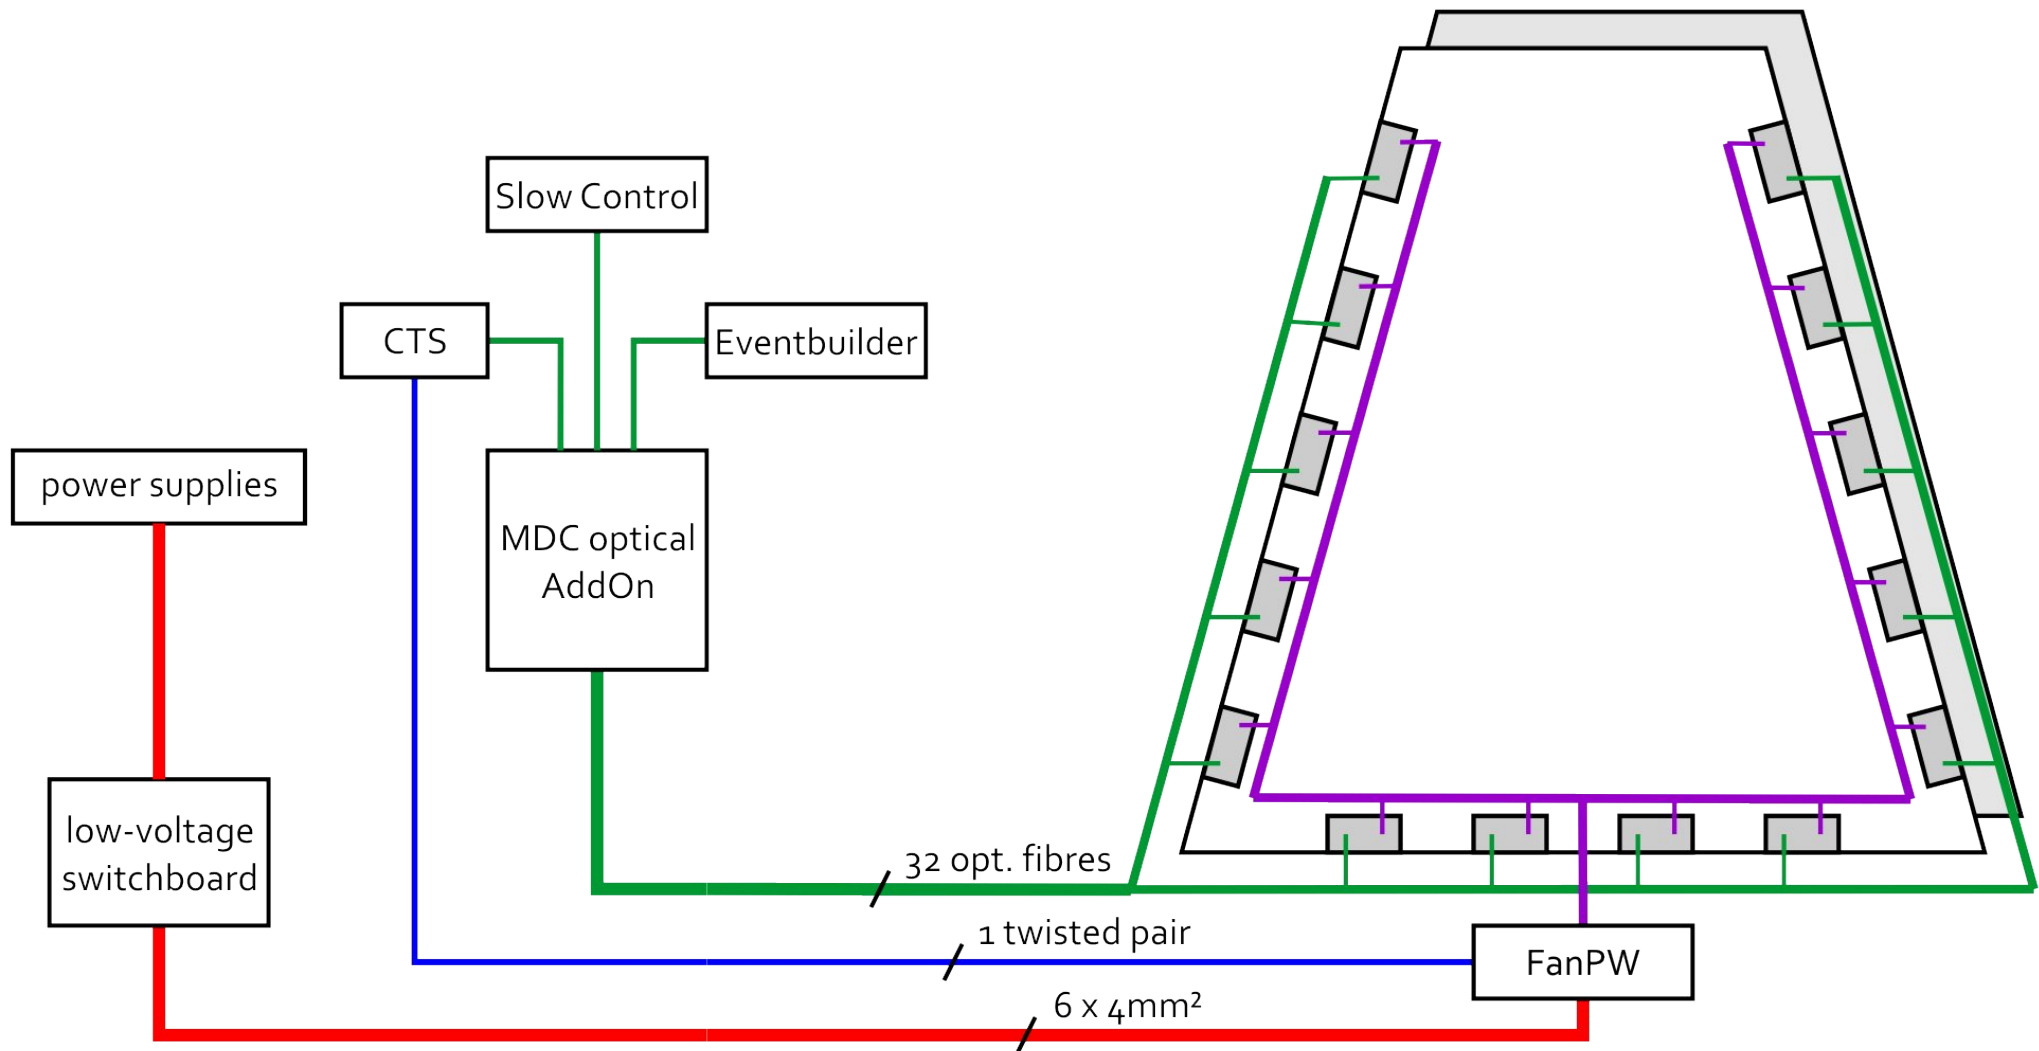

# MDC DAQ: Trigger Distribution

# MDC DAQ: Optical Network

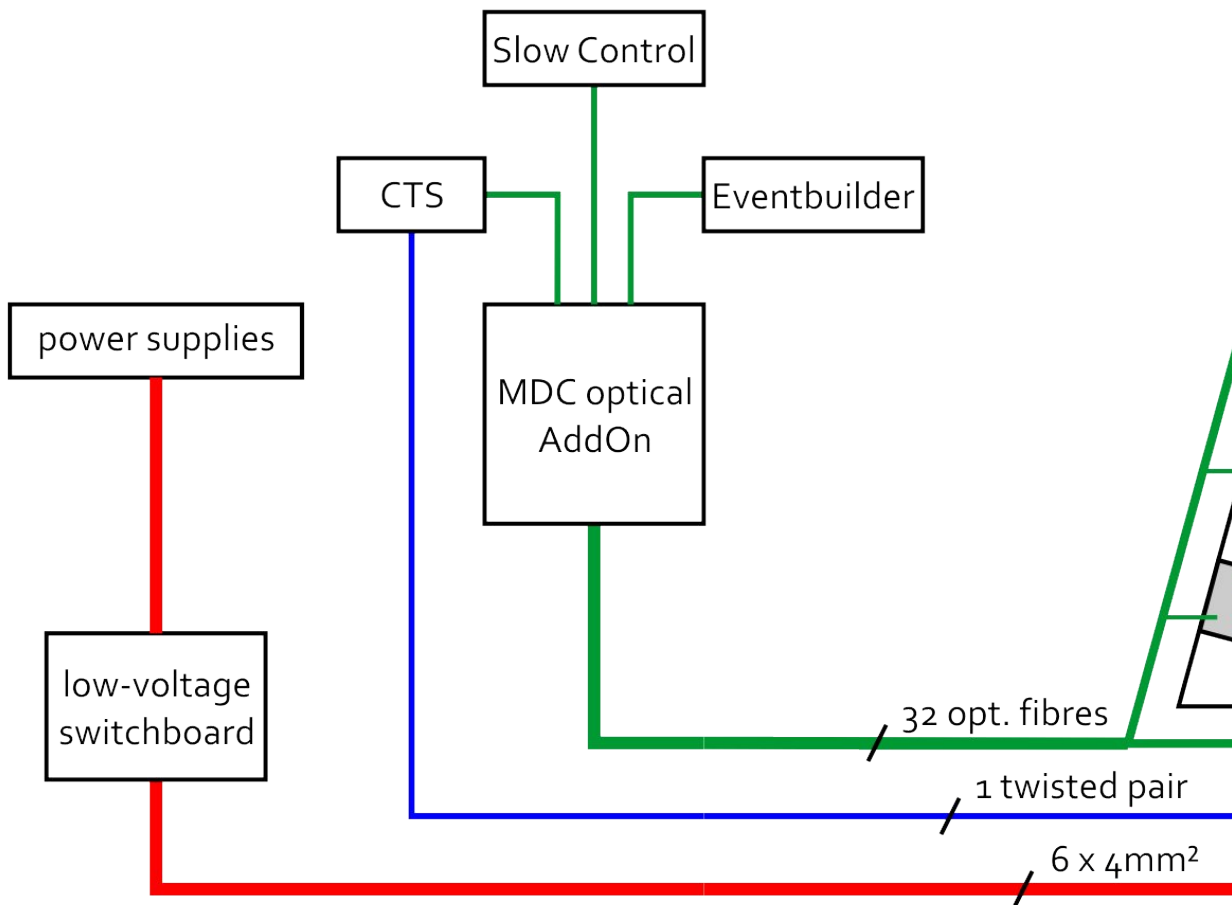

# MDC DAQ: Optical Network

# MDC DAQ: Optical Network

# MDC DAQ: Optical Network

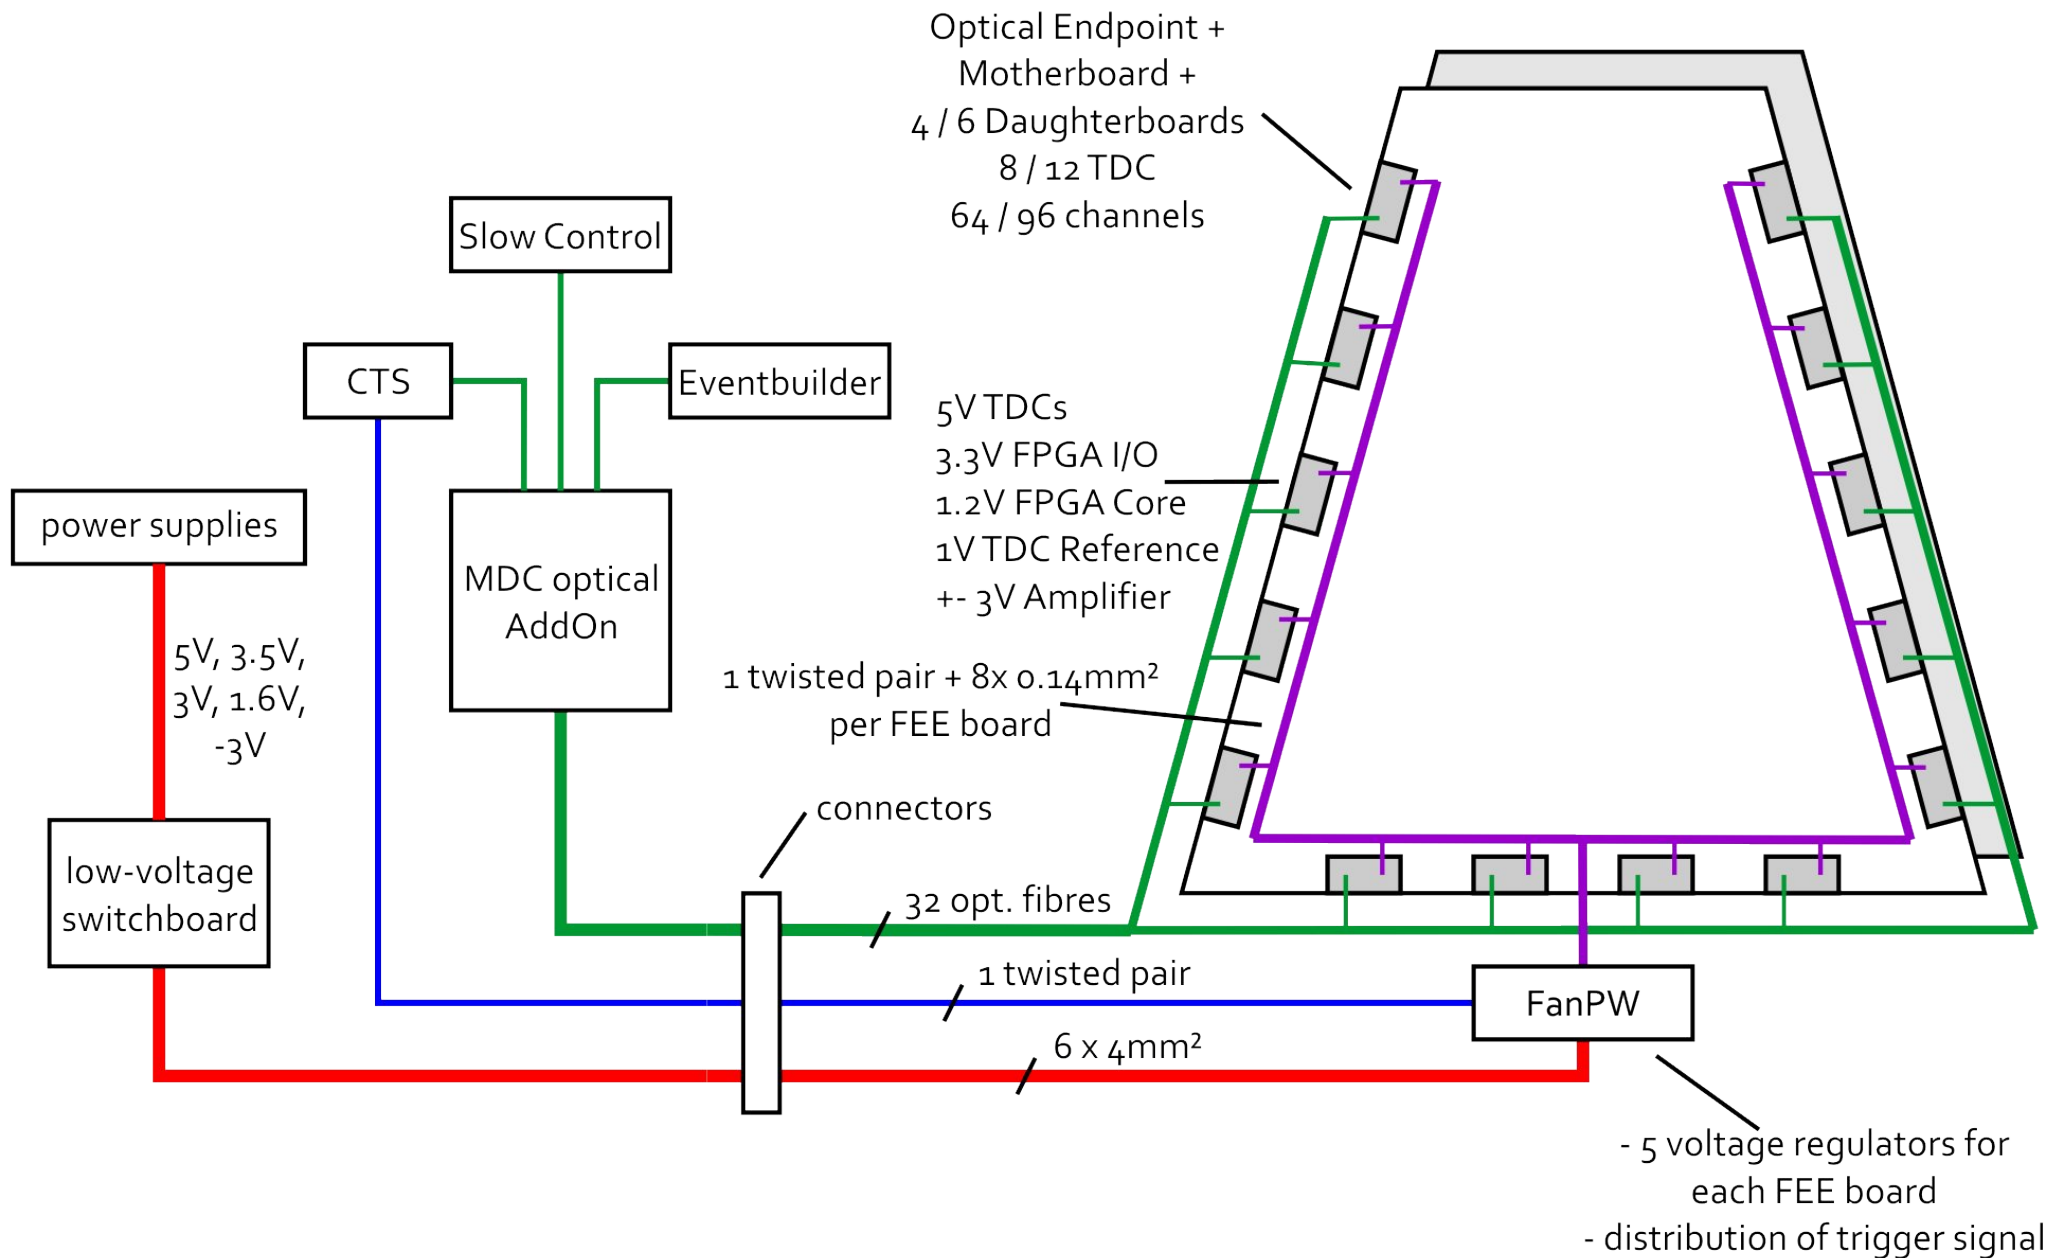

1 twisted pair

6 x 4mm<sup>2</sup>

# MDC DAQ: Optical Network - Components

# MDC DAQ: Current Status

---

- Power Supplies: **installed**
- Low-voltage Switchbox: **installed**
- Cable from switchbox to chambers: **installed**
- Optical cables from AddOn mounting point to chambers: **installed**
- Optical Endpoints: **mass production running, 40 ready**
- MDC AddOns: **4 prototypes available, mass production: end of year**
- Readout tests & noise measurement with one half chamber: **successful**
- All chambers equipped with new readout: **~ december**

# MDC DAQ: Software - libtrbnet

---

- C-Library to access all Boards inside DAQ optical network
- Allows to manually test all request types on TrbNet
- Main purpose: Slow Control / Debugging / Monitoring
- Split into TrbNet-library, FPGA-connection library & high-level software
  - Easy to implement in own code

## Commands:

r <trbaddress> <register>	-> read register
w <trbaddress> <register> <data>	-> write register
rm <trbaddress> <register> <size> <mode>	-> read register-memory
wm <trbaddress> <register> <mode> <file>	-> write to register-memory from ASCII-file
i <trbaddress>	-> read unique ID
s <uid> <endpoint> <trbaddress>	-> set trb-address
T <input> <type> <random> <info> <number>	-> trigger by slowcontrol
I <type> <random> <info> <number>	-> read IPU data slowcontrol
f <channel>	-> flush FIFO of channel
R <register>	-> read register of the FPGA
W <register> <value>	-> write to register of the FPGA

```
> trbcmd i ffff
0xee000001e43c17c1 0x01
0x8e000001fc533228 0x01
```

# MDC DAQ: Software - trbflash

---

- Programming flash ROMs (FPGA design) on all OEPs and RICH ADCM via trbnet
- Much faster than conventional programming via JTAG
- Can programm all 400 boards at once
- Essential tool – some boards are not accessible after mounting

```
> trbflash program 0xffff mdc_oepb_golden_alpha3.bit
Found 2 Endpoint(s) of type MDC
NAME: mdc_oepb_golden_alpha3.bit
DATE: Mon Oct  5 11:23:25 2009
USER:
Start programming ImageFile 'mdc_oepb_golden_alpha3.bit'
You decided to reprogram the FlashRom(s) #1 of MDC, are you sure [N,y]: y
