

Updates on PionTracker

- 1) Timing Cuts
- 2) Crosstalk
- 3) Final multiplicities (candidate pairs)
- 4) Momentum reconstruction

Timing Cuts

For each strip (of each detector layer) time is defined in reference to the Start Detector and shifted around 0

Timing Cuts

For each detector, time difference between X and Y plane is calculated and a (common???) cut is applied to select pion candidates

Crosstalk

For each strip (of each detector layer) nearby strips can be fired due to crosstalk; this has to be checked and corrected looking at the distance between 2 hits on the same layer

Pion candidates (pairs) and multiplicity

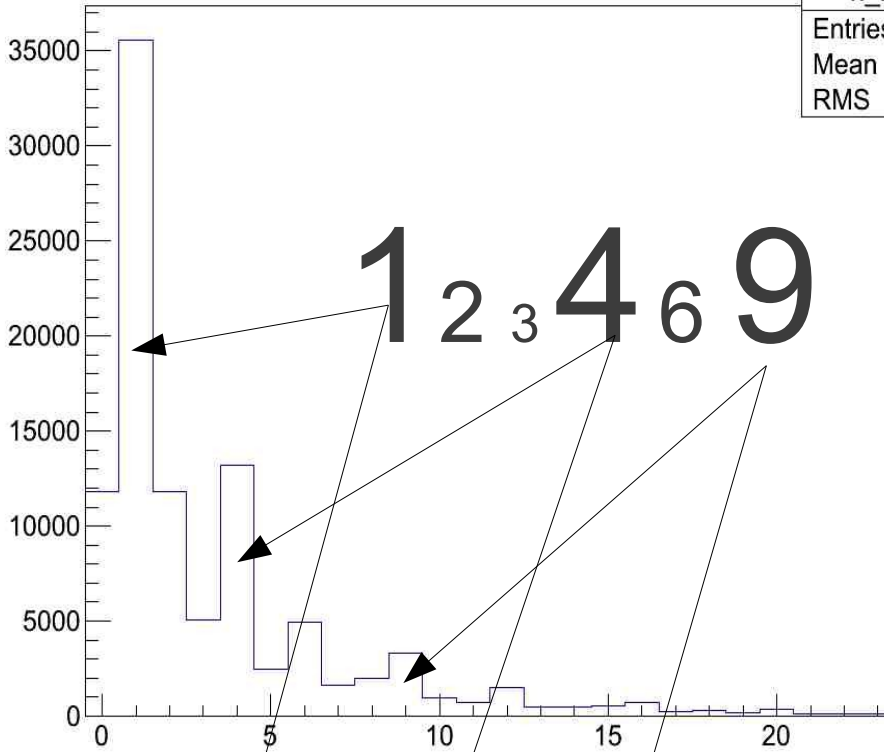

Pion candidates multiplicity

h_multp0

h_multp0

is ~ 80 %

Momentum Reconstruction

HPionTrackerTrack.fData.fP

mom	
Entries	599827
Mean	0.7037
RMS	0.02203
χ^2 / ndf	7.909e+04 / 43
Prob	0
Constant	$1.153\text{e}+05 \pm 1.869\text{e}+02$
Mean	0.7016 ± 0.0000
Sigma	0.01801 ± 0.00002

Momentum is
reconstructed with a
resolution of

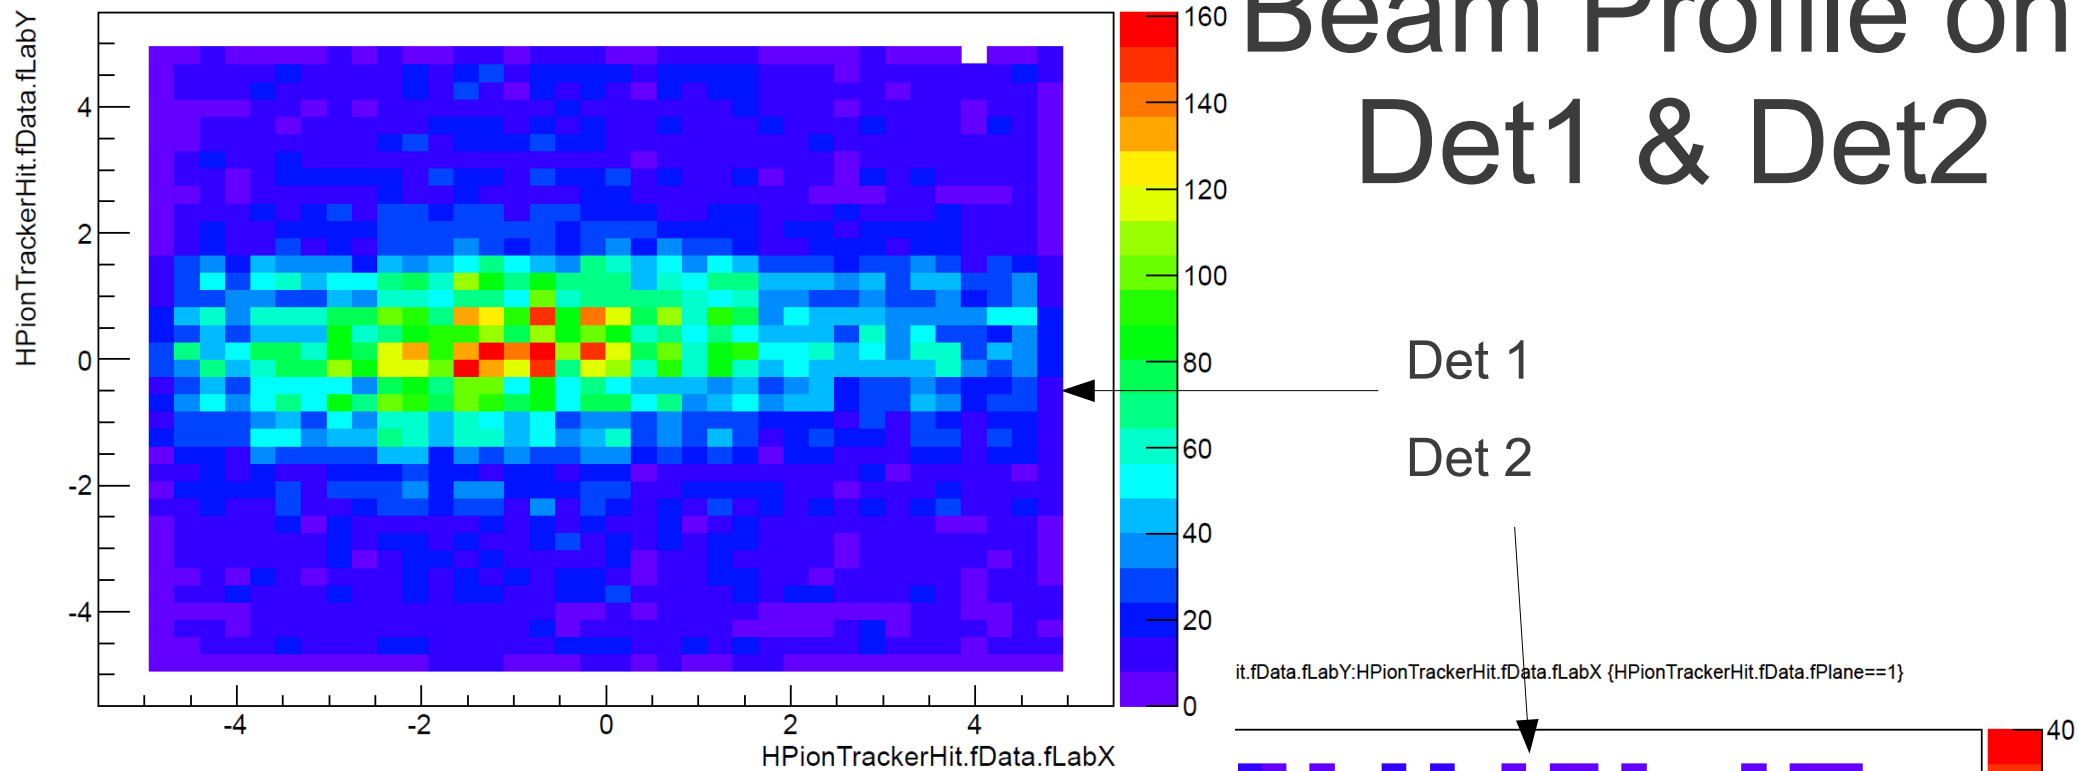

$$\sigma P/P \sim 0.027$$

HPionTrackerTrack.fData.fP

With a finest binning, the
asimmetry becomes evident;
where does it come from?

Beam Profile on Det1 & Det2

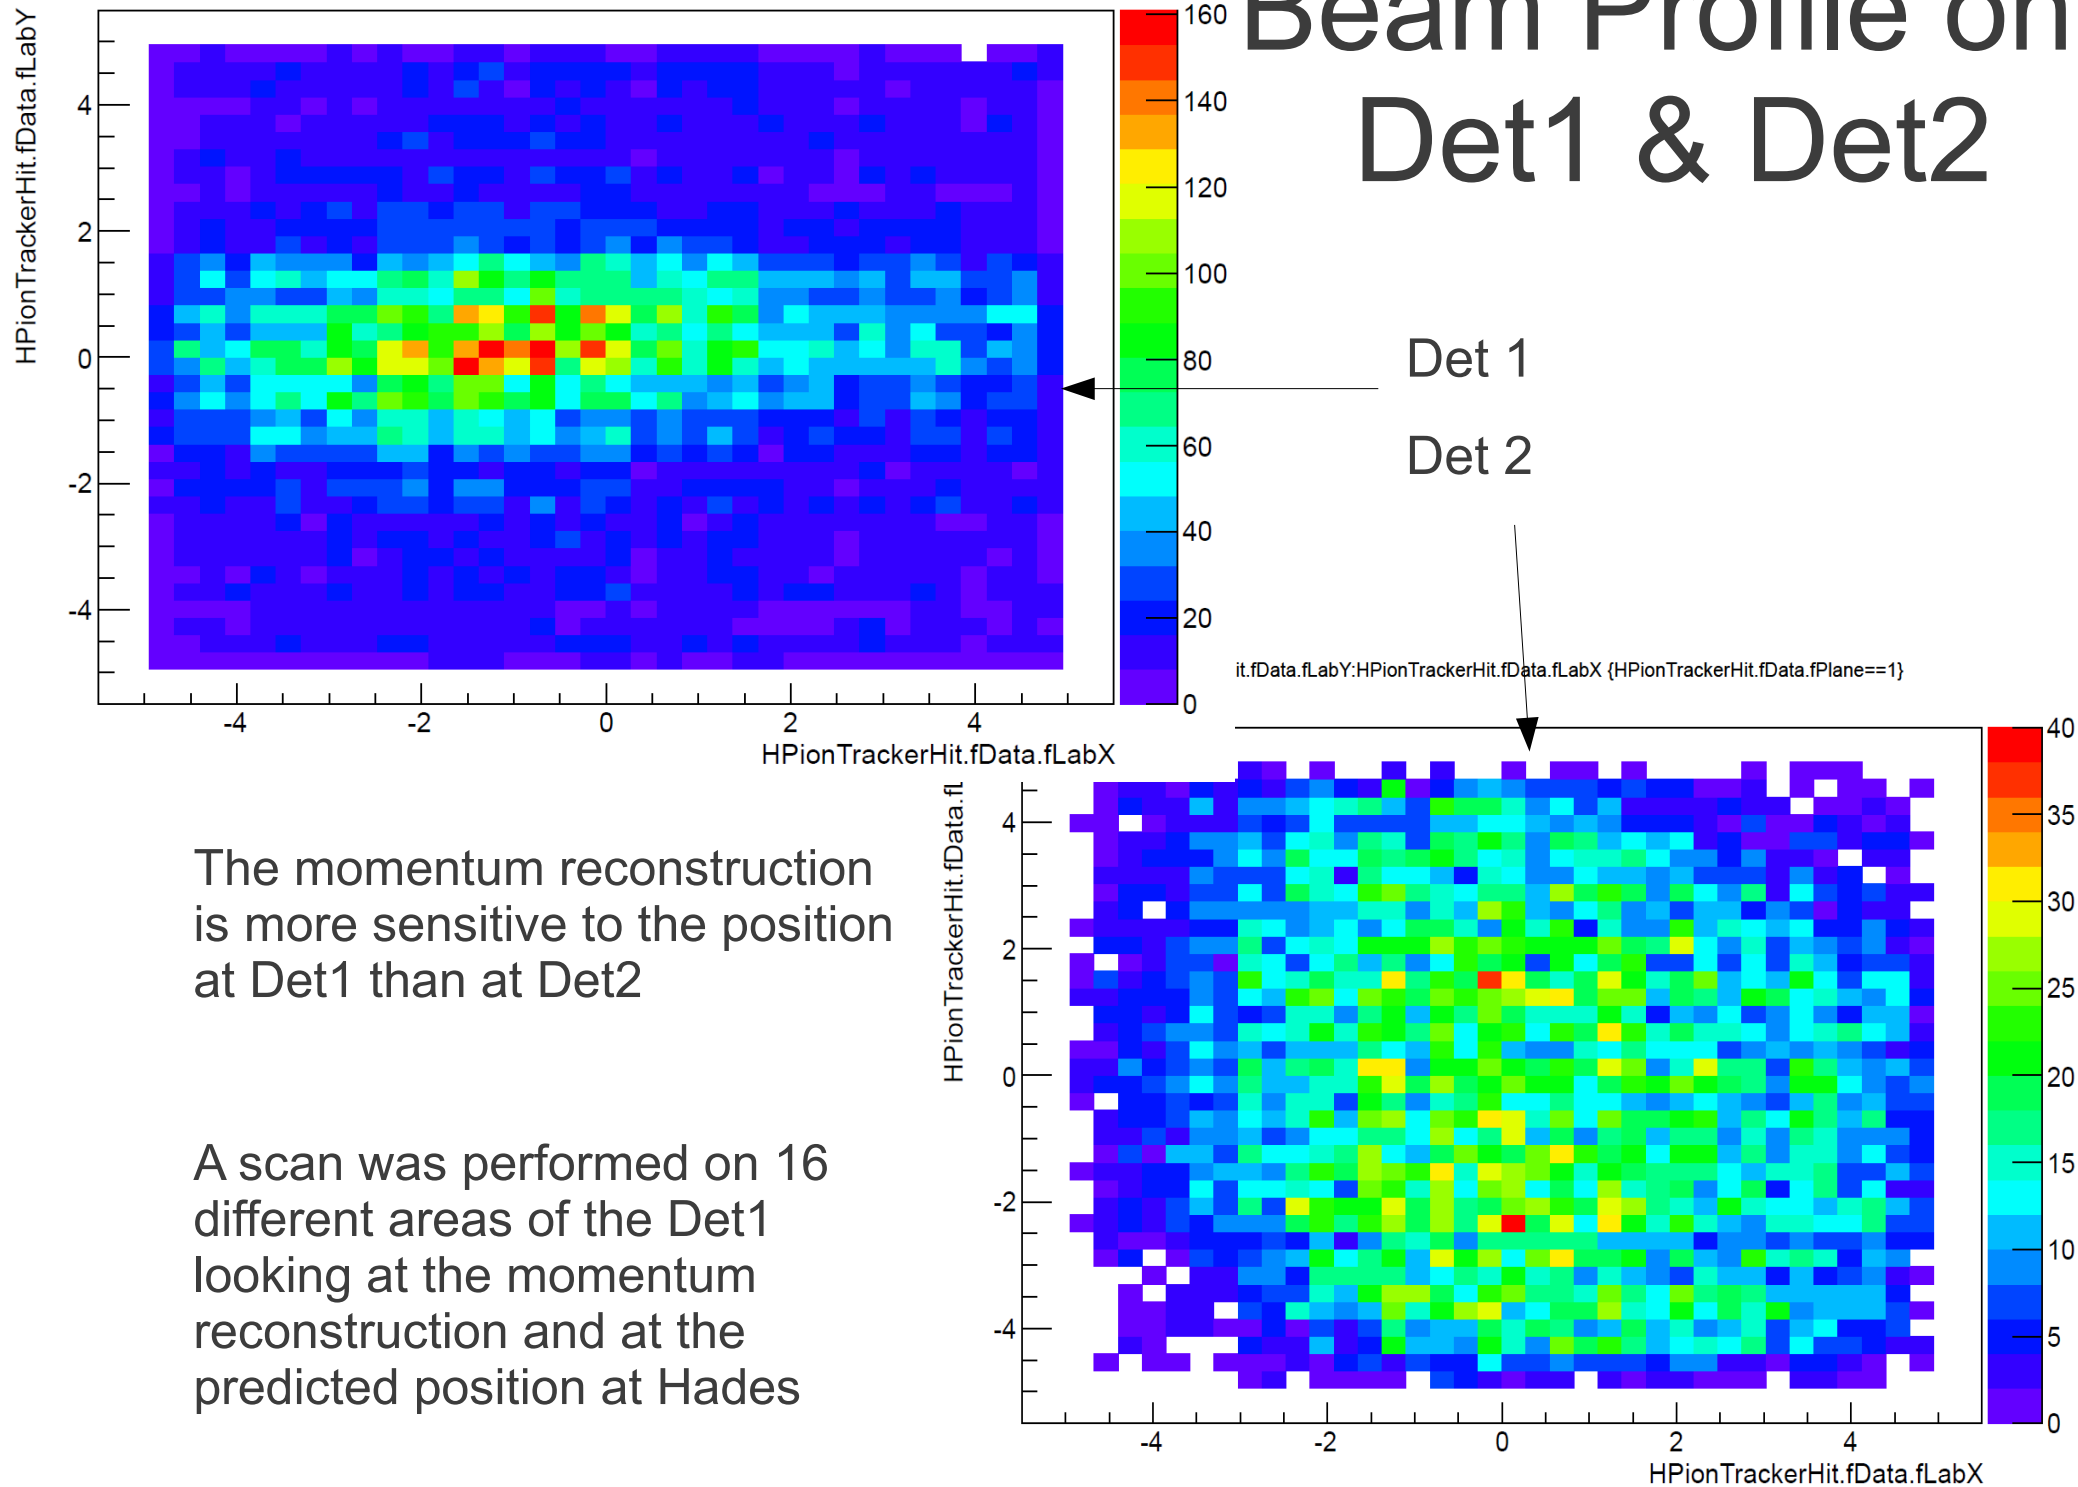

The momentum reconstruction is more sensitive to the position at Det1 than at Det2

A scan was performed on 16 different areas of the Det1 looking at the momentum reconstruction and at the predicted position at Hades
